

130 - 300mm AUTO ADJUSTING 6 WHEELED SKID Model No CE190

The 130 - 300mm Auto Adjusting 6 Wheeled Skid can accept the 33mm and the 46mm Camera. Having 3 x wheels at the front and 3 x wheels at the back makes the Skid easy to deploy and to recover. The 3 x Springs allows the Unit to adjust to the internal diameter automatically which keeps the Camera in the centre of the pipe.

The free wheel allows the user to reach long distances into the pipe without too much drag. The whole Skid measures 270mm long and can extend to 300mm. When fully extended the length decreases to 240mm.

Installing a Camera into the Skid could not be simpler. The Camera (46mm) is pushed in from the back and there are 3 x finger tightening screws which are tightened equally so that the Camera sits firmly in the centre right at the front of the Skid. The Skid is deployed ready for use.

If a 33mm Camera is used, a 46mm Collar is inserted over the Camera and inserted into the back of the Skid. 3 x finger tightening screws are tightened equally so that the Camera sits firmly in the centre right at the front of the Skid. The Skid is deployed ready for use.

33mm Camera with 46mm Collar

Once work is finished, please remove the Centraliser from the Camera and wash with fresh water.
